

Why does my child sometimes continually repeat the same actions when they play?

It's possible your wee one is engaging

Schematic Play

this happens when babies, toddlers and young children repeat actions or behaviours to explore the world around them and find out

how things work. There are many kinds of

- Young children benefit from opportunities to repeat and practise different actions. This helps their brain development and learning.
 - for example, actions of up and down, going from side to side and rotating supports early writing development.

"I am

A black and white line drawing of a baby sitting in a high chair, facing forward. The baby is wearing a bib and holding a spoon. Above the baby's head is a large, stylized eye with a wavy line above it. Handwritten text is overlaid on the image, reading:

"nings move"

chasing

One of the earliest
observed in babies... Will often from their highchair, throw food on or toys

A black and white line drawing of a baby sloth wrapped in a blanket. The sloth has a small, round head with large, dark eyes and a tiny nose. Its body is covered in short, dark hair. It is wrapped in a light-colored, textured blanket with small circular patterns. To the right of the sloth, the word "swaddling" is written vertically in a stylized, blocky font. The background is plain white.
